

Welcome!

Webinar #2: SCRIPTS in Thermoflow Programs

- Introduction: Why Scripts?
- Scripts in GT PRO, GT MASTER and THERMOFLEX
- Script Definition
- Managing Script Variables
- Examples
- * Q & A Session

Presenter: IGNACIO MARTIN (SPAIN)
Support: Meritt Elmasri (U.S. HQ)

Thermoflow Training and Support

- Standard Training
- On-site Training course
- Advanced Workshop
- Webinars when new version is released
- Help, Tutorials, PPT, Videos, ...
- Technical Support

→ Feature Awareness Webinars

Feature Awareness Webinars

1- Assemblies in THERMOFLEX

2- Scripts in Thermoflow Programs

INTRODUCTION: Why Scripts?

- Philosophy of Thermoflow software
- How to interact with Thermoflow programs
 - ELINK
 - ULINK
 - User Defined Components in TFX
 - Adjustment methods, Correction factors,...
 - **Scripts**

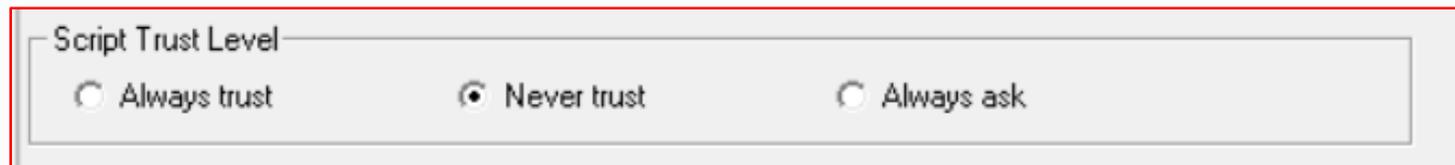

SCRIPTS in:

- THERMOFLEX, Version 23, since 2013
- GT MASTER, Version 24, since 2014
- GT PRO, Version 26, since 2016

SCRIPTS:

Scripting functionality allows users to create and compute custom outputs or to set certain inputs using code written in the scripting language Lua

Special Note: Scripts can be dangerous. They can link to and run code and other programs that are not immediately visible from the script editing. Do not run a script that you think may contain malicious or harmful code.

A screenshot of a software dialog box titled 'Script Trust Level'. It contains three radio button options: 'Always trust', 'Never trust', and 'Always ask'. The 'Never trust' option is currently selected, indicated by a filled radio button.

Basic Lua Documentation

THERMOFLEX uses the scripting language Lua, version 5.1.4.

Documentation in → <http://www.lua.org/>

Compiled Windows binaries, libraries, and a code editor

→ <https://github.com/rjpcomputing/luaforwindows>

Lua and Lua for Windows available under the terms of the MIT license

→ <http://opensource.org/licenses/mit-license.php>.

Full online documentation for version 5.1:

→ <http://www.lua.org/manual/5.1/manual.html>

SCRIPT Definition:

Script Name

The screenshot shows the 'Script Manager' window with the 'Define Scripts' tab selected. The 'HPT/HP Sourcing' script is highlighted in the 'Scripts' list. The 'Script Properties' section shows 3 inputs and 2 outputs. The 'Script Body' section contains the following Lua code:

```
1
2 -- Initialize output tables
3 sop = {} -- Script Output Parameters
4 tfip = {} -- ThermoFlow Input Parameters
5
6 -- Start wrapper function
7 function TFLua_Main(CallOrigin, ConvergenceStatus, ...)
8   --[[ This code is automatically generated to place inputs into a local
9     table for ease of use ]]
10
11   local sip = {n=select('#',...),...}
12
13   -- User code begins here:
14
15   -- Pass output values to the script output parameter array
16   if sip[1]>550 then
17     tfip[1]=0 --Main HP process flow
18     tfip[2]=10 --1st HPT sub flow
19   else
20     tfip[1]=10 --Main HP process flow
21     tfip[2]=0 --1st HPT sub flow
22   end
23
24   -- End wrapper function
25
26 end
```

Script Body

SCRIPT Parameters:

Custom Script Inputs: name, description and Units (TFIP)

Script Inputs from program (GTP-GTM-TFX) : input parameters to be determined by the Script (TFIP)

Script Outputs: custom output parameters to be computed by the Script (SOP)

Script Inputs: inputs and outputs from the program required by the Script (SIP)
(Custom Script Inputs must be added here)

→ Caution: notice the difference on Units: “Current display” and “Native”

Unit conversion within the script is left to the user

SCRIPT Parameters:

Custom Input Parameters
 Define custom input parameters for this model. The values of these parameters can be edited from the TFX Edit Inputs menu. The custom script inputs defined here are made available to any and all scripts in this file.

Parameter Name	Description	Unit	Current display	Native
Number of Engines in operation	Number of Engines in operation			
New custom input				

Buttons: Add, Up, Down, Remove, Select, Current display, Native.

Script Output Parameters (SOP)
 Define custom script output parameters to be computed by this script.

Parameter Name	Description	Unit	Current display	Native

TFX Input Parameters (TFIP)
 Select THERMOFLEX input parameters to be determined by this script.

Parameter Name	Description	Unit	Current display	Native
Fuel Specification [14] : Flow divider value	Fuel Specification [14] : Flow divider value			
Gas/Air Specification [7] : Flow multiplier value				
Gas/Air Specification [13] : Flow divider value				
Water Specification [11] : Flow divider value				
Water Specification [12] : Flow multiplier value				
Water Specification [27] : Flow multiplier value				
Water Specification [28] : Flow divider value				
Power Device: Multiplier of Reciprocating Engine S				
Auxiliary Device: Multiplier of HRSGAssembly[1]; Ec				

Buttons: Add, Up, Down, Remove, Select, Current display, Native.

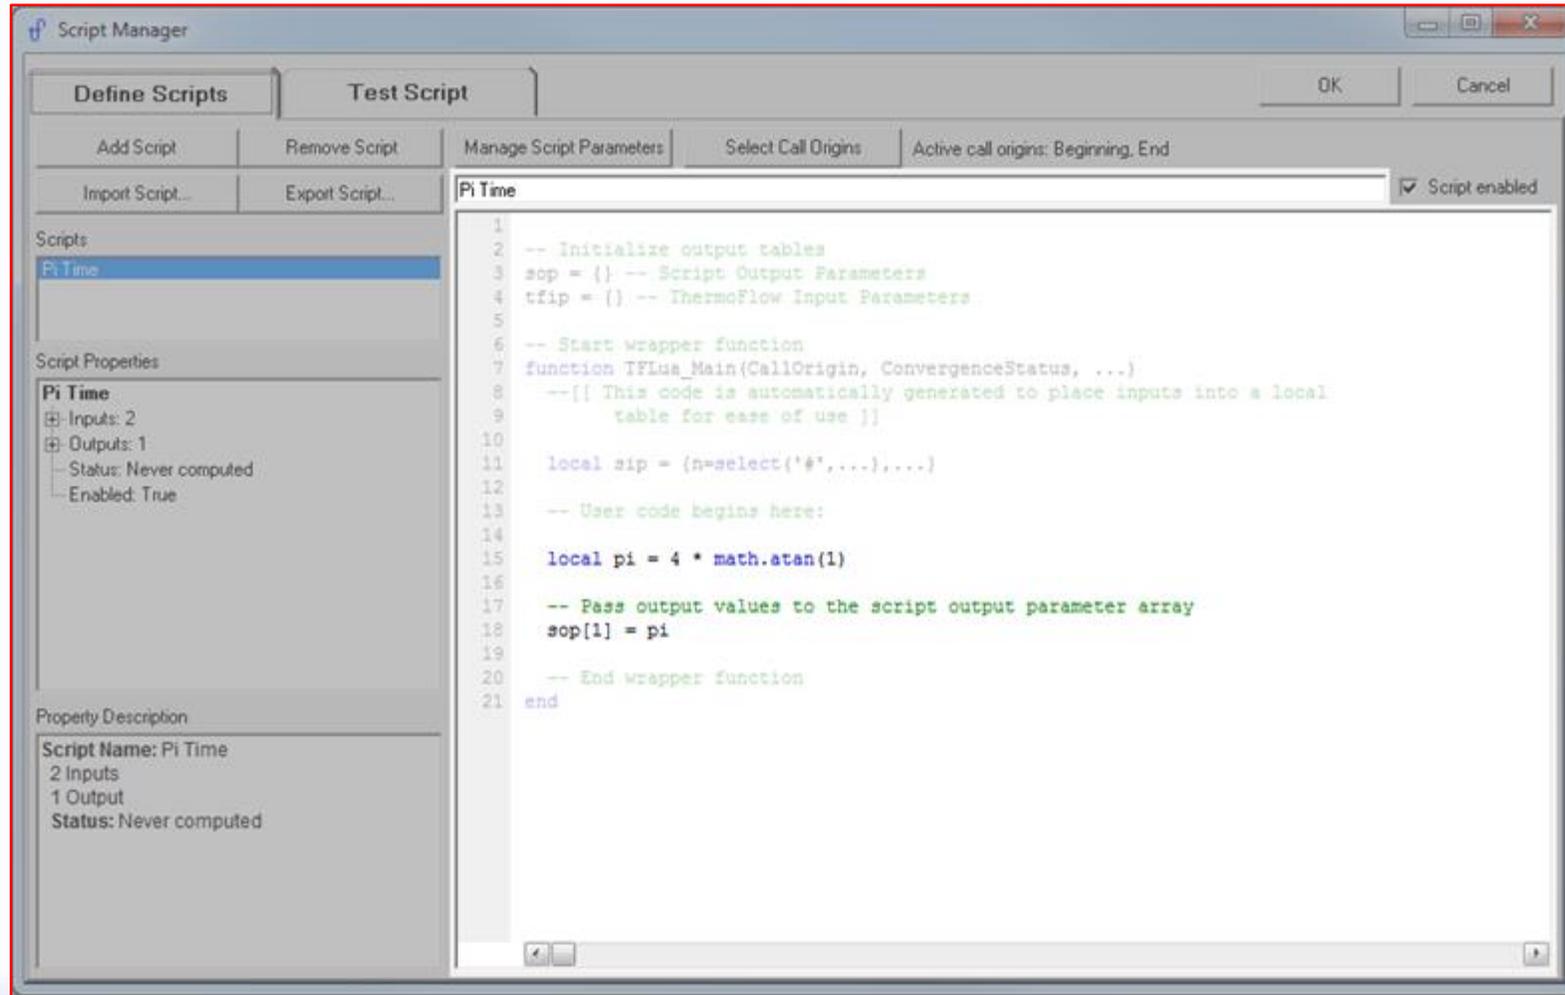

Bottom buttons: OK, Cancel

Script Input Parameters (SIP)
 Select the parameters required by this script. The call origin flag and the convergence status are always passed into the script and cannot be removed from this list.

Parameter Name	Description	Unit	Current display	Native
Call Origin	Call Origin			
Convergence Status				
Custom Inputs: Number of Engines in operation	This value identifies the origin of this call to the script computation routine. See the scripting documentation for a more-detailed description.			

Buttons: Add, Up, Down, Remove, Select, Current display, Native.

SCRIPT “Code”:

SCRIPT “Call Origin”

1. **At the beginning of computation** before anything else has been computed

Allows a script to set THERMOFLEX input parameters before beginning the computation.

2. **During the main computation loop**

Allows a script to set inputs during the computation instead of waiting for convergence. This can give a result faster, but is also more likely to make the model unstable.

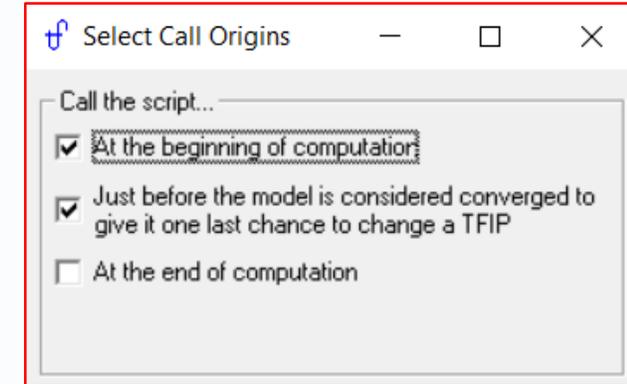

3. **Just before the model is deemed converged** to give the script one last chance to change THERMOFLEX input parameters (TFIPs)

Allows a script to set inputs that change the flow or pressure relational matrices

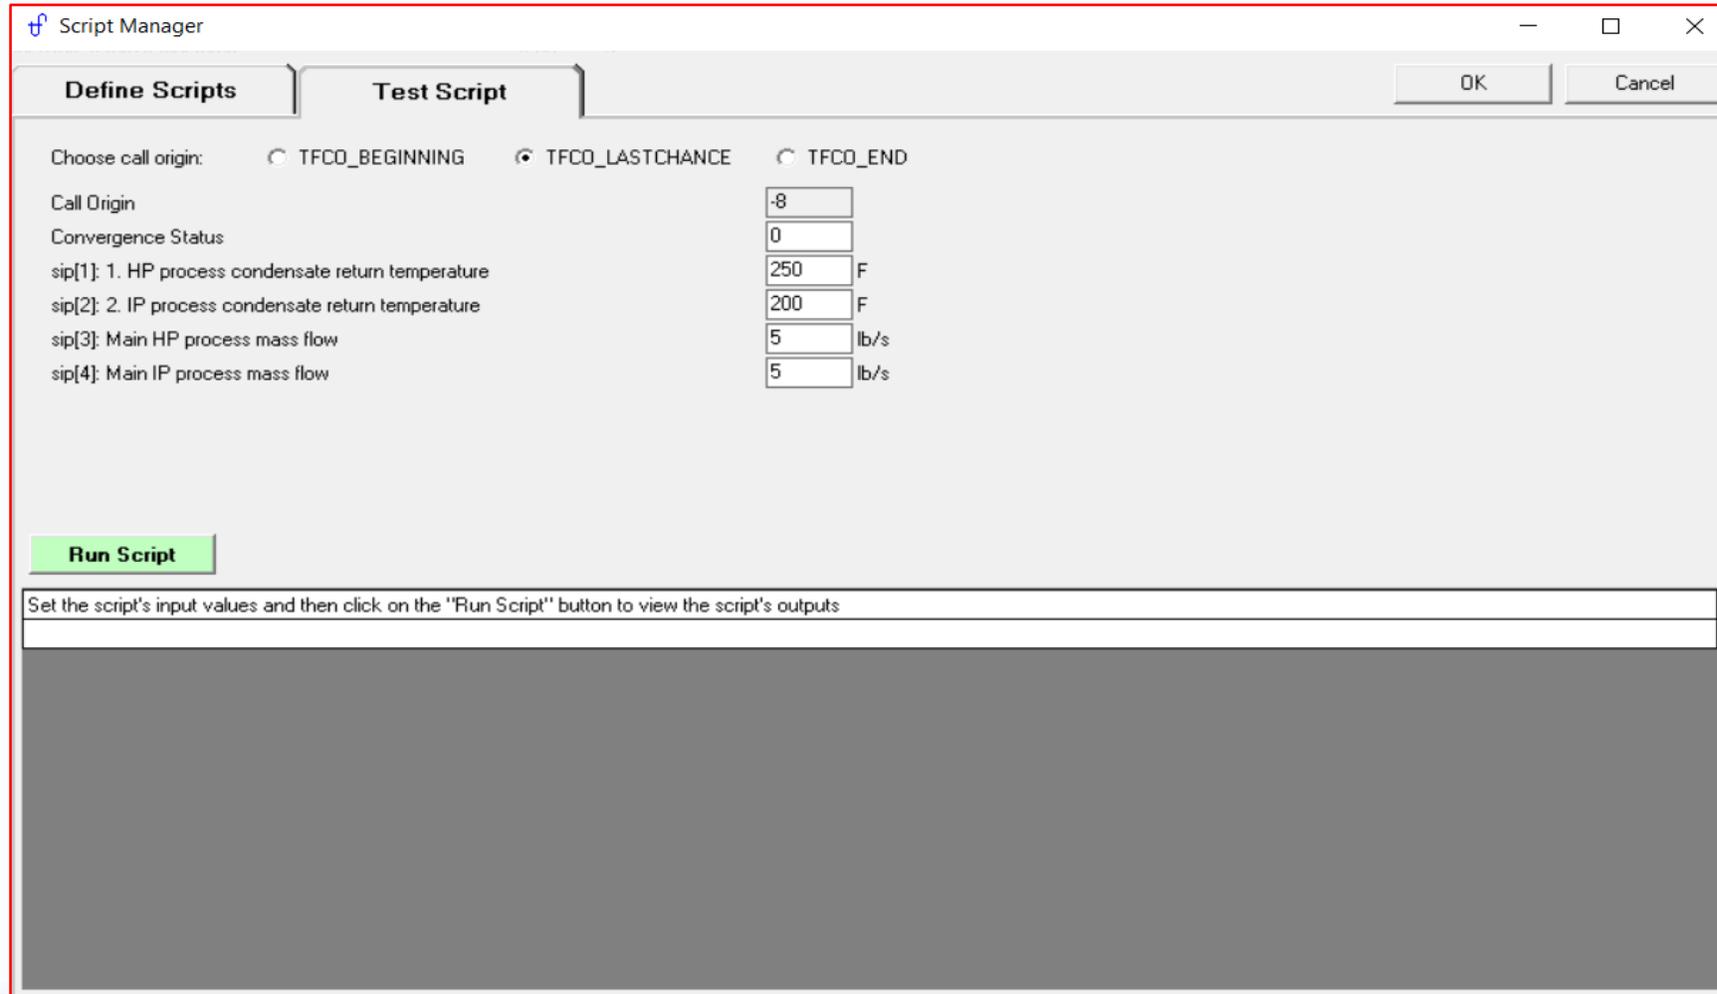

4. **At the end of computation** after all other outputs have been computed

Allows a script to compute custom outputs using the final results of the computation.

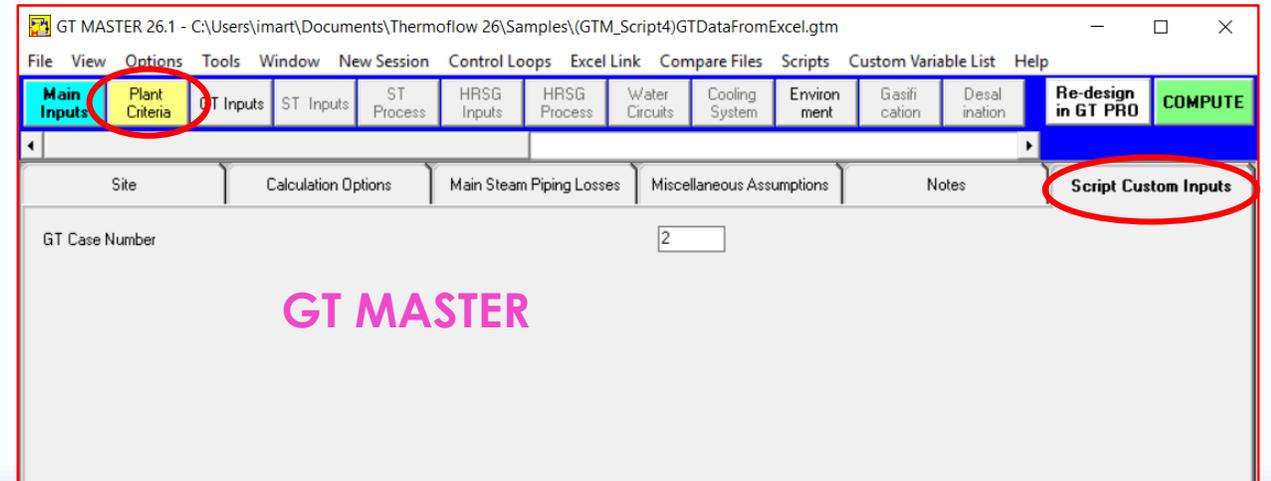

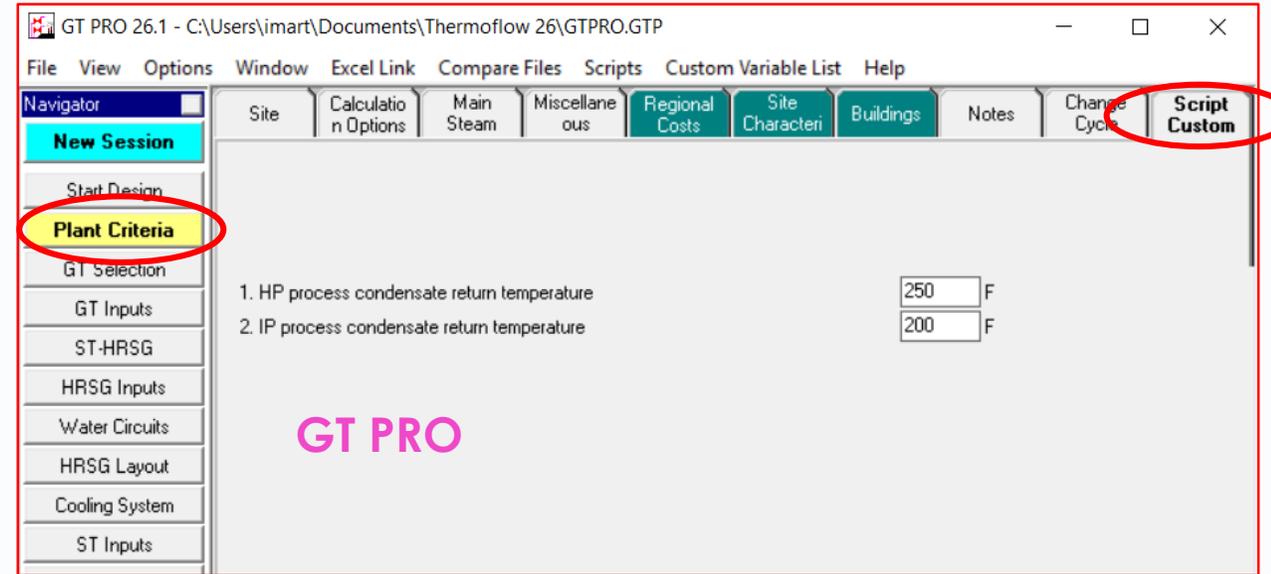

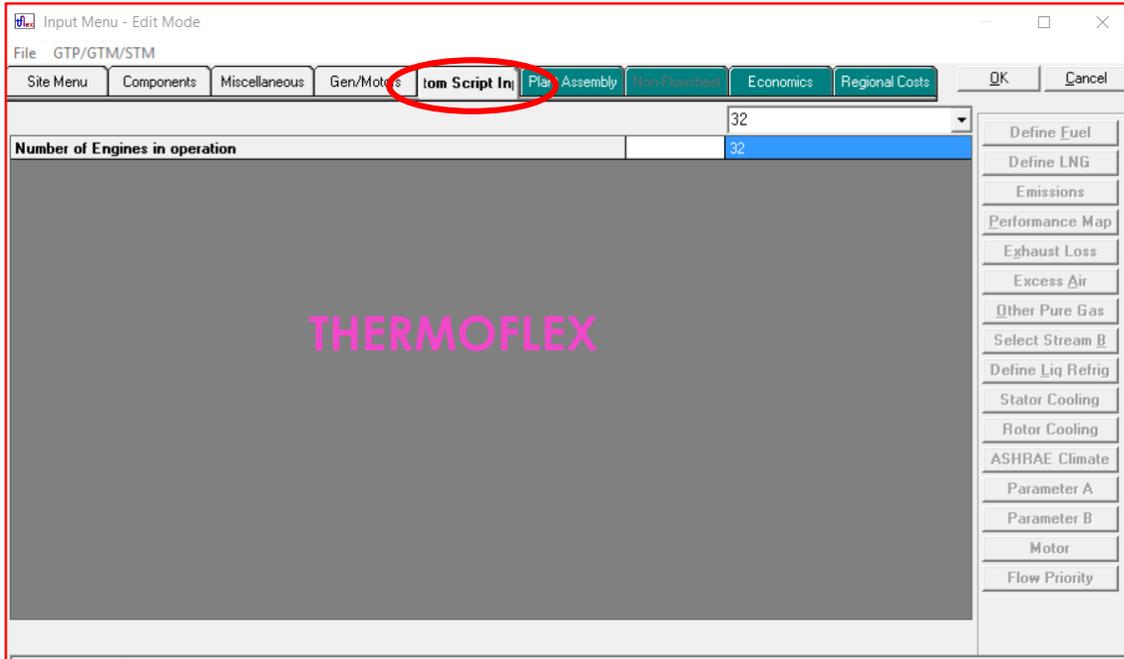

THERMOFLEX input parameters are not set at this time. Computation is over, so setting TFIPs to new values at this point would have no effect on the results.

Auxiliary Device: Multiplier of Pump (PCE) [3]	32

SCRIPTS Compatible with

- Multiple Runs
- ELINK
- TFX: “Classic” Macros, Searcher

Import and Export SCRIPTS

Importing: Things that are always preserved

The following properties of an imported script are always preserved:

- Name and body
- Call origins
- Script Output Parameters

Importing: Things that are never preserved

The following properties of an imported script are never preserved:

- Script Input Parameters (sips) that refer to custom inputs
- Custom inputs, file-specific.

Importing: Things that may be preserved

Script Input Parameters (sips) and Thermoflow Input Parameters (tfips) are links to variables in the main program hosting the script. When a script is imported, the script will ask the main program (e.g. THERMOFLEX, GT PRO, or GT MASTER) if its sip and tfip variables are still available in the current file. If they are, the variables will be preserved. If they are not, then the variables will be cleared and the script itself will also be disabled.

This process may not be perfect. It is up to the user to ensure that all of an imported script's sips and tfips have been properly assigned, and to reassign them if necessary.

When importing a script exported from a different program (i.e. importing a script exported from THERMOFLEX into a GT PRO file, or a script made in GT PRO into a THERMOFLEX file, etc.), all sips and tfips will be cleared.

SCRIPTS Samples

GT PRO:

- (GTP_Script1)Different_Condensate_Return_Temperature
- (GTP_Script2)Different_Steam_Export_Prices
- (GTP_Script3)Script_DB_STkW

GT MASTER:

- (GTM_Script1)ExtractionSelector
- (GTM_Script2)ACC_Scheduling
- (GTM_Script3)CustomOutputs
- (GTM_Script4)GTDataFromExcel & (GTM_Script4)GTDataFromExcel.xls

THERMOFLEX:

- (S2-36)Load Scheduling 6-on-1 CC Plant
- (S2-37)Modeling M-on-N Plant Using Scripts
- (S5-22) SolarPV with Gas Turbine Backup using Scripting
- (S5-23) WindFarm with Gas Turbine Backup using Scripting

SCRIPTS Help:
