

THERMOFLOW SOFTWARE SUITE COMPUTER SYSTEM REQUIREMENTS

OPERATING SYSTEM

Windows 10 and 11 (32 and 64-bit versions)

MEMORY

We recommend at least 2 GB of RAM. Generally, the programs will run faster if more memory is available, reducing disk swapping time.

HARD DISK STORAGE

Installation of the programs will require about 2.5 GB. These requirements include reasonable allowance for storage of customer files and substantial space for several tutorials installed with the programs.

PORT FOR HARDWARE KEY

A USB port is required for the enabling hardware security key.

INTERNET CONNECTIVITY

An internet connection is required to download and register the software, but is not needed for normal operation.

GRAPHIC OUTPUTS

The programs can print output graphics on any printer supported by the Windows operating system. They can also be stored as Windows metafiles which may then be plotted, printed, or imported into some word processors and drawing programs. Once in the word processor, they can be combined with text and/or printed on any printer supported by the word processor.

ELINK (ThermoFlow's Add-In for computing heat balance files from within Excel)

The ELINK add-in is compatible with 32-bit and 64-bit desktop versions of Excel that support VSTO add-ins. This includes all currently-active desktop versions of Microsoft Office (Office 2016, 2019, and 2021 and their Microsoft 365 desktop app equivalents).
